ABSTRACT

The status of women enrolled in collegiate and noncollegiate schools in spring 1976 and social and economic characteristics of these students are examined, based on data from the U.S. Census Bureau's 1976 Survey of Income and Education. For students who were dependents, information is presented on their families. Findings include the following: over 5 million women were enrolled in college in spring 1976, and they comprised 45 percent of the total college enrollment; the economic and social characteristics of women and men college students were very similar; women had about the same rates as men for being financially dependent on their parents, working while attending school, and attending college but not completing 4 years; 60 percent of all women students and 56 percent of all men'students attended college full time; enrollment rates for women and men were similar except in the age bracket 22 to 34 years, in which a smaller proportion of women were enrolled in college; a larger proportion of women independent college students were in the highest income category compared with men independent college students; 8 percent of women independent college students and 4 percent of men independent college students were living below the poverty level; among those independent full-time undergraduate. students who worked, women earned less during the year than men; nearly one and a half million women 16 years old and over were enrolled in noncollegiate schools; and 16 percent of women independent noncollegiate students were Living below the poverty level, double the proportion of men independent noncollegiate students. This report is one of a series of five reports which describe the socioeconomic characteristics of different groups of postsecondary students in 1976, using Survey of Income and Education data: The other reports cover:

- Students with Language Backgrounds other than English
- Hispanic Students
- Black Students
- Students Twenty-five Years and Older

Technical Notes, available in a separate report, describe the survey methodology and provide definitions and standard errors for selected items.

Susan Hill served as project officer of the contract to conduct secondary analyses of Survey of Income and Education data. Susan Hill and Alice Kroliczak coauthored the reports, on the characteristics of postsecondary students. Joseph Foomkin, of Joseph Froomkin Inc., conducted the analyses of the data under contract to NCES.

HIGHLIGHTS

Over 5 million women were enrolled in college in the Spring of 1976; they comprised 45 percent of the total college enrollment.

The economic and social characteristics of women and men college students were very similar. Women had about the same rates as men for: being financially dependent on their parents, working while attending school, and attending college but not completing four years.

Sixty percent of all women students and 56 percent of all men students attended college full-time.

Enrollment rates for women and men were similar except in the age bracket 22 to 34 years, in which a smaller proportion of women were enrolled in college.

A larger proportion of women independent college students were in the highest income category compared with men independent college students.

Eight percent of women independent college students and four percent of men independent college students were living below the poverty level.

Among those independent full-time undergraduate students who worked, women earned less during the year than men.

Nearly one and a half million women, age 16 and over, were enrolled in noncollegiate schools in the Spring of 1976; they accounted for 47 percent of the total enrollment in noncollegiate schools.

Sixteen percent of women independent noncollegiate students were living below the poverty level, double the proportion of men independent noncollegiate students.

INTRODUCTION

Women have the educational prerequisites for a fuller participation in higher education; in 1976, the proportion of women who had graduated from high school was the same as that of men, 63 percent. However, the proportion of women who had completed four years of college was only 11 percent of all high school graduates, two percentage points lower than that of men. The largest difference was observed in the proportion of men and women who went beyond the four years of college (baccalaureate level). Only 6 percent of all women high school graduates, as contrasted with 12 percent of men, went beyond the undergraduate level.

This report describes the status of women enrolled in collegiate and noncollegiate schools in the Spring of 1976 and presents a profile of the social and economic characteristics of these women students. It is based upon data collected in 1976 by the Census Bureau, using the Survey of Income and Education.1/ The report discusses women in college first, and is followed by a chapter on women in noncollegiate education. In the case of financially dependent students, information is presented on their parental families. Standard errors have been calculated, and differences between groups are cited only if the difference was statistically significant at the .05 level or beyond.

^{1/} For definition of terms and a description of the Survey of Income and Education, see the Technical Notes.

CHAPTER 1

ENROLLMENT IN COLLEGE

Participation Rates

A total of 5.4 million women were enrolled in college classes in the Spring of 1976. Women comprised 45 percent of the total college enrollment, although they comprised 52 percent of the total population 16 and over, and of all high school graduates.

Student Characteristics

Some 80 percent of the 5,438,000 women students enrolled in college were undergraduates. The remainder were persons who had completed four years of college, and were now enrolled in regular or adult education classes at a college. At the undergraduate level, a greater proportion of women than men attended college full-time (table 1).

1 Amore

Wirtually the same proportions (about 40 percent) of men and women high school graduates age 18-21 were enrolled in college.

In the age bracket 22 to 34, the prime child-bearing period and the age when most post-baccalaureate studies are undertaken, the percent of women high school graduates attending college was smaller than that of men. In the 22-24 age bracket, women trailed men by nine percentage points. In the 25-34 age bracket, the proportion of women high school graduates who were enrolled in college was still six percentage points lower than that of men. At older age groups, e.g., 35 to 64, the proportion of high school graduates enrolled in college was 4 percent for both women and men (table 2).

Dependency' Status

A little over half of women college students were financially dependent on their parental families, as opposed to being financially independent of their parental families, i.e., living on their own or with their husband and/or children. The proportion of women students who were attending college full-time was 86 percent for dependent students and 32 percent for independent students. These attendance patterns are very similar to those observed for men (table 3).

Independent	•	3,253	1 00	1.040	32	2,213	68

Note: Details may not add to totals because of rounding.

Financial Resources of Dependent Students and Their Families

Almost half of women dependent college students had parents whose income was \$20,000 or over (table 4). On the other extreme, however, one-twelth of women dependent college students lived in families where parental income was less than \$5,000. Another eighth were members of families with parental income between \$5,000 and \$10,000. There were no significant differences between the parental incomes of women and men dependent college students.

Table 4. -- Dependent women and men college students by attendance status and income group: 1975

		Wome	en ·		Me	n

Number (in thousands)	2,810	2,413	397	3,263	2,651	612	

Note: Details may not add to totals because of rounding.

However, when both family income and the number(of persons living in the student's family are taken into consideration, there is a statistically significant difference between the percentages of wome and men dependent college students who lived in families with incomes below the poverty level (for family size). About 4 percent of women dependent college students lived in families with incomes below the poverty level, compared with 3 percent of men (table 5).

Table .5. - Dependent college students living in poverty by sex: 1975

<u>` </u>		<u> </u>
Poverty status	Women 1	Men
Percent of students in families below poverty level *	4	3.
Number in poverty (in thousands)	115	85

^{*} For definition of the term poverty level, see the Technical Notes.

With the exception of the proportion of dependent college students living in poverty, the family incomes of men and women were similar. The relative economic parity of families of women and men dependent college students can also be illustrated in terms of assets. About 40 percent of families with dependent daughters and sons enrolled in college had estimated assets of \$40,000 or more (table 6).

Table 6. -- Dependent women and men college students, by size of family financial assets: 1975

^{*}Includes nonresponse and those whose owner-occupied property and/or mortgage exceeded \$100,000.

The proportions of students who worked during the year were similar for women and men dependent full-time undergraduate students. Among full-time undergraduate students, about 80 percent of women and men reported working during the year. However, women who worked earned less than men; on the average, women dependent full-time undergraduate students earned about \$500 less during the year (table 7).

Table 7. -- Earnings of women and men dependent full-time undergraduate students.

who worked*	\$1,402	\$1,917	

^{*}The difference between the two means is significant at the .05 level.

Financial Resources of Independent Students

Amongostudents who were financially independent of their parental families, larger proportions of women than men were in the highest income category. Some 29 percent of all women independent college students had individual or family incomes of over \$20,000 compared to 22 percent of all men independent college students. Also, 8 percent of women independent college students and 4 percent of men independent college students were living below the poverty level (table 8).

CHAPTER 2

ENROLLMENT IN NONCOLLEGIATE SCHOOLS

Nearly one and a half million women, age 16 and over, were enrolled in noncollegiate postsecondary schools in the Spring of 1976. Their enrollment accounted for 47 percent of the total enrollment in noncollegiate schools. Seventy percent of these women noncollegiate students attended school part-time (table 11).

Table 11. - Women and men enrollment in noncollegiate schools, by attendance status: 1976

		То	tal		Full-time	*	Part-time '

Women	•	1,367 1,536	47 53	•	405 486	30 s	962 1,050	70 68

Of the 1,367,000 women 16 and over enrolled in noncollegiate schools, 21 percent were not high school graduates and 79 percent had graduated from high school. These proportions were similar to those for men noncollegiate students (table 12).

Although 70 percent of both women and men students in noncollegiate schools were over 24 years old, a larger proportion (42 percent) of women students were over 34 years old compared with 36 percent for men students. The age distribution of women students who were high school graduates was different than that for women who had not graduated from high school. Among high school graduates, 40 percent were age 35 or older; of non-high school graduates, 50 percent were over 34 years old (table 12).

16

Financial Resources of Dependent Students and Their Families

An estimated 216,000 women noncollegiate students (or 16 percent) were financially dependent on their parental families. The rest were financially independent.

Slightly more than a third of women dependent noncollegiate students lived in , families where the parental income was less than \$10,000, compared with almost a half of men dependent noncollegiate students (table 13).

Table 13. — Dependent women and men noncollegiate students, by attendance status and income group: 1975

10

When both family income and the number of persons living in the student,'s family are taken into consideration, there is no statistically significant difference between the percentages of women and men dependent noncollegiate students who lived in families with incomes below the poverty level. Some 49 percent of both women and men dependent noncollegiate students lived in poverty-level families (table 14).

Table 14. —Percent of dependent noncollegiate students living in poverty, by sex: 1976

Poverty	Women	Men	
Percent of students in families below poverty level*	9	, 9	•
Number in poverty (in thousands)	2 0 ,	27	4

^{*}For definition of the term poverty level, see the Technical Notes.

About a fifth of dependent women and men noncollegiate students reported that they had no assets, while another fifth of women and men had assets of \$40,000 and over (table 15).

Table 15. — Dependent women and men noncollegiate students, by size of family assets: 1975

No information* (in thousands)	2 4	29	

^{*}Includes nonresponse and those whose owner-occupied property and/or mortgage exceeds \$100,000.

Note: Details may not add to total because of rounding.

About 60 percent of women and men dependent full-time noncollegiate students worked during the year. It is not possible to provide any reliable information on the earnings of dependent full-time noncollegiate students because the sample size for this group was too small (table 15).

Table 16. -- Percent of women and men dependent full-time noncollegiate students with earnings: 1975

Item	Women	Men	
Number of students (in thousands)	130	1 92	
Percent with earnings	62	57.	

Financial Resources of Independent Students

The proportion of women independent noncollegiate students in the lowest income category was more than twice the proportion of men independent noncollegiate students in this category. Slightly more than a fifth of women independent noncollegiate students had individual or family incomes under \$5,000 in contrast with a tenth of the men independent noncollegiate students. Also, 16 percent of women independent noncollegiate students were living below the poverty level, double the proportion for men independent noncollegiate students (table 17).

^{*}For purposes of this report, the family of an independent student means the student's family of procreation, i.e., spouse and/or children living at home.

Note: Details may not add to totals because of rounding.

About 30 percent of women and men independent noncollegiate students reported that they had no assets. In addition, 35 percent of women and 45 percent of men independent noncollegiate students had assets under \$20,000. In other words, less than a third of the independent noncollegiate students of either sex had substantial assets (table 18).

Independent women who were attending noncollegiate school full-time were just as likely to be employed as independent men full-time noncollegiate students. About 70 percent of women and men independent noncollegiate students reported being employed during the year. It is not possible to provide any reliable information on the earnings of independent full-time noncollegiate students because the sample size for this group was too small (table 19).

Table 19. -- Percent of women and men independent noncollegiate students with earnings: 1975

Item	Women	Men

^{*}The difference between these two means is not statistically significant at the 0.5 level.

CHAPTER 3

CHARACTERISTICS OF FAMILIES WITH STUDENTS ENROLLED IN POSTSECONDARY EDUCATION

Among dependent students in college and in noncollegiate schools, nearly half of both women and men lived in families where the family head had attended or graduated from college.

Table 20. -- Dependent women and men postsecondary* students, by educational attainment of family head: 1976

Educational attainment of		1	
parental family head	Women	~/ Men	
	Percent	age distribution	
Total	100	400	•

Some high school	11 .	12	
High school graduate	31	. 31 .	•
Some college	17	17	
College graduate (30	, 29	
Total number (in thousands)	3,027	3,575	

^{*}Postsecondary includes both collegiate and noncollegiate students.

One in twenty women dependent students lived alone with a parent. A fifth lived in families with six or more members. These proportions were about the same for men dependent students (table 21).

Among independent students, there is a significant difference between the proportions of women and men students who lived alone and also between women and men students who lived in two-person families. Some 20 percent of women and 24 percent of men lived alone, while 30 percent of women and 25 percent of men lived in two-person families. Similar proportions of women and men lived in families with more than two persons (table 21).

Table 21. -- Women and men postsecondary students, by family size and dependency status: 1976

Dependency status		ì	lumber o	f persor	s in f	amily

Women	100	6	23	2 9	20	22	
Men	100	. 6	25	, 29	, 19	21	•
Independent	Total	One	Two	Three	Four	or more	
Women	100	20 -	30	18		32	
Men	100	24	25	18		33	

Among dependent students, eight percent of both women and men had more than two other family members attending postsecondary education. Two-thirds of all dependent women and men postsecondary students were the only family members attending school (table 22).
